ABSTRACT

1.1 Problem Background

The tourism and travel industry requires efficient management of tour packages, customer bookings, payment tracking, and administrative control. Traditional manual systems often result in booking errors, data redundancy, inefficient record management, and security vulnerabilities.

Existing travel management platforms are either expensive, complex, or lack customization features for small and medium-scale travel agencies. There is a need for a secure, scalable, and user-friendly digital platform that automates operations while ensuring proper access control and data security.

1.2 Objective of the Project

The primary objective of the Smart Tour & Travel Management System is to design and implement a secure and efficient web-based platform that:

- Automates tour package creation and management
- Enables customer registration and secure authentication
- Facilitates online booking and payment tracking
- Provides an administrative dashboard for monitoring
- Implements role-based access control for enhanced security

1.3 Proposed Solution / System Overview

The Smart Tour & Travel Management System is a full-stack web application developed using modern backend technologies.

The system follows a layered architecture consisting of:

- Controller Layer
- Service Layer
- Repository Layer
- Database Layer

1.4 Key Features or Functionality

The system provides:

- Secure user registration and login
- Role-based access (Admin & Customer)
- Add, update, delete tour packages
- Online booking and booking history
- Payment status tracking
- Dashboard analytics for administrators
- Organized database management
- RESTful API-based communication

1.5 Technology / Method Used

The project is developed using:

- Spring Boot – Backend framework
- MySQL – Relational database
- Spring Data JPA – Database interaction
- JWT Authentication – Secure login & authorization
- REST APIs – Client-server communication
- Layered Architecture Design Pattern

This technology stack ensures scalability, maintainability, performance, and security

1.6 Expected Outcome & Benefits

The developed system:

- Reduces manual workload and human errors
- Ensures secure and authenticated access
- Improves booking accuracy and payment tracking
- Enhances operational efficiency

- Provides scalable architecture for future expansion

The system is beneficial for travel agencies, customers, and administrators by offering a centralized digital solution for travel management.

1.7 Original Contribution Statement

The Smart Tour & Travel Management System integrates secure authentication, structured booking management, payment tracking, and role-based administrative control within a scalable Spring Boot architecture.

The originality of this project lies in:

- Implementation of secure JWT-based authentication
- Role-based access control mechanism
- Layered architecture for clean code structure
- Custom-built travel management solution tailored for institutional academic implementation

The system is independently designed and developed as a final year academic project.
